

The maximum recommended length of an entire DMX run is 1000'. Longer runs can be achieved using a DMX repeater. The maximum number of devices on a DMX network is 32. Install a DMX terminator at the end of the DMX run. Each Ilumipod Inground 36 IP draws a maximum of 40W.

This fixture requires the Ilumicode remote addresser to change the starting address, change the personality, change the dimming curve, or to set the fixture to operate on a static program.

This fixture can project a static scene in the absence of a DMX controller.
